

U-Boot Environment

Problem description: the U-Boot boot process needs a long time.

Solution: the `ethact` variable is auto-set by U-Boot when an ethernet controller is configured (default). It should not be set if you disconnect USB ethernet and disable PCIe using the following commands:

```
Tegra3 # setenv pciconfighost  
Tegra3 # saveenv  
Tegra3 # reset
```

Please note that in this case PCIe will be enabled in the Linux kernel. If you want to re-enable PCIe in U-Boot use the following commands:

```
Tegra3 # setenv pciconfighost yes  
Tegra3 # saveenv  
Tegra3 # reset
```
